

HW-16 AGC Modification, Part 2

Installing the AGC Switch:

Well, Jim came through again with a no holes added recommendation by replacing the "REL. PWR/PLATE" switch with a DPDT Slide Switch. Great idea and it enables **Fast and Slow AGC** in this configuration. ☺

Half of the Switch is used as it was for the "REL. PWR/PLATE" function, and the other half is used for the **Fast/Slow AGC** functions.

With this arrangement there is always AGC in the circuit. The "NO AGC" is not available with this switch arrangement.

I wound up mounting the Capacitors on the top of the chassis by the Switch and just ran one wire to point Four (4) on the schematic.
